If & else

- Distinguish between two cases
- Action depends on result of comparison

```
a = 5 #define variable
#user inputs number
b = int( input("please enter number!") )
if b < a:#if b is smaller than a
    print("b is smaller than a")
else:
    print("b is NOT smaller than a")
```

```
please enter number!3
b is smaller than a
```

elif

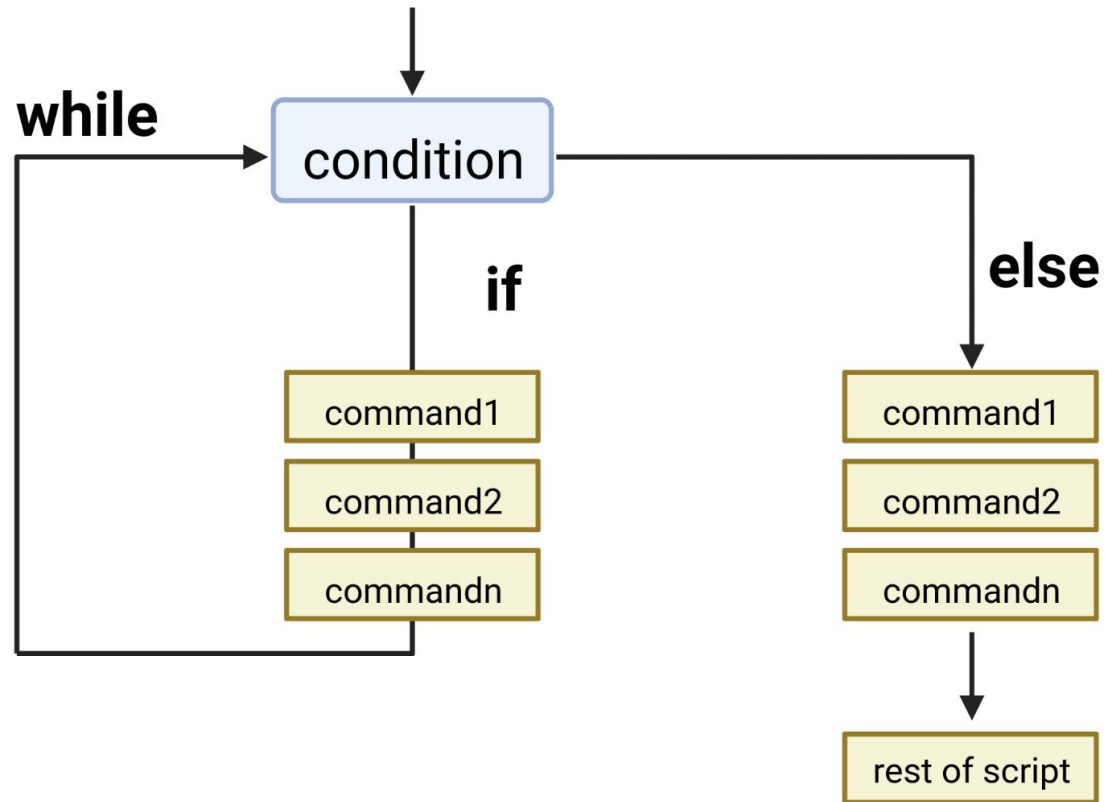

- Distinguish between multiple cases
- Action depends on result of comparison

```
a = 5 #define variable
#user inputs number
b = int( input("please enter number!") )
if b < a:#if b is smaller than a
    print("b is smaller than a")
elif b == a:
    print("b is matching a")
else:
    print("b is bigger than a")
```

Exercises - Part3a

- 3.1) Write a script for guessing numbers!
- 3.2) Add tips (smaller/larger) during the guessing process!

Concept of loops

While loop (example)

```
1 a = 0
2 while a < 10:    #checks if a is smaller than 10
3     print(str( a ) + " is smaller than 10")
4     a += 1      #a = a+1
5     #something useful could happen here
6     print("a was increased by 1")
7 print(str( a ) + "is larger than 10")
```

Code is executed until the
condition for this loop becomes
false

While infinite loop

WARNING: this loop is infinite!

```
1 #infinite loop:
2 a = 0
3 while True: #always true
4     a += 1 #a = a+1
5     print(str( a ))
6 print("this line is never reached")
```

For loop

Control variable (species)

List of data (list_of_species)

```
1 list_of_species = [ "E.coli", "B.subtilis", "S.cerevisiae", "C.glutamicum", "A.tumefaciens"
2 for species in list_of_species:
3     if len( species ) < 12: #Length of names is calculated and compared
4         print(species)      #Name is printed
5
6 #Line 3+4 is executed several times:
7 #1: species = "E.coli"
8 #2: species = "B.subtilis"
9 #3: species = "S.cerevisiae"
10 # ...
```

Species name is printed if
shorter than 12 characters

Exercises - Part3b

- 3.3) Write a function counting to 100 and printing all number which can be divided by 4 without any residue!
 - Info: `10%2` #modulo division in Python
- 3.4) Write a function counting down from 1000 to 0 and printing all numbers!
- 3.5) Generate a list of species names! Write a function that prints all species names starting with 'E'!
- 3.6) Expand this function to limit the printing to species names which are additionally shorter than 10 characters!
- 3.7) Expand this function to limit the printing to species names which are additionally ending with 'a'.

Exercises - Part3b (addition)

- X1: Print species names that match at least 2 of the following 3 conditions: (1) longer than 8 characters, (2) start with 'E', (3) end with 'a'
- X2: Print species names that are identical to the previous or next species name in the list.

range()

```
1 list_of_species = ["E.coli", "B.subtilis", "S.cerevisiae", "C.glutamicum", "A.tumefaciens"]
2 length = len( list_of_species ) #length = 5
3 for i in range( length ): #starts at 0 and runs to i=4 (five values)
4     if len( list_of_species[ i ] ) < 12: #length of name is calculated and compared
5         print(list_of_species[ i ]) #name is printed
6
7 #i is taking five different values:
8 #1: i=0
9 #2: i=1
10 #3: i=2
11 #4: i=3
12 #5: i=4
13 #i=5 is never reached by range()
```

enumerate()

```
1 list_of_species = ["E.coli", "B.subtilis", "S.cerevisiae", "C.glutamicum", "A.tumefaciens"]
2 for idx, species in enumerate( list_of_species ):
3     if len( species ) < 12: #length of names is calculated and compared
4         print("position of " + species + " is: " + str( idx ))
5
6 #i is taking five different values:
7 #1: i=0 and species="E.coli"
8 #2: i=1 and species="B.subtilis"
9 #3: i=2 and species="S.cerevisiae"
10 #4: i=3 and species="C.glutamicum"
11 #5: i=4 and species="A.tumefaciens"
12 #i=5 is never reached
```

Exercises - Part3c

- 3.8) Write a script to print 50x 'here' and the current value of the control variable!
- 3.9) Write a script to walk through the species list and to print the character from the species where the index corresponds to the current control variable value!

Checking a list/string for a sublist/substring

- Check if an element is contained in a list:

```
genes = ["g1", "g2", "g3", "g4", "g5"]  
if "g3" in genes:  
    print("g3 in genes")
```

g3 in genes

- Check if a substring is contained in a string:

```
genome_seq = "ACACCGATTACTGGAGGTTACGTAATGGCCA"  
primer = "ACTGGAGGTTACG"  
if primer in genome_seq:  
    print("primer binding site detected.")  
else:  
    print("no primer binding site detected")
```

primer binding site detected.

Time for questions!
